

If there's a file named `test.lox` with the following contents:

```
var language = "lox";
```

The `tokenize` command will return the following:

```
$ ./your_program.sh tokenize test.lox
VAR var null
IDENTIFIER language null
EQUAL = null
STRING "lox" lox
SEMICOLON ; null
EOF null
```

This output format matches the spec in the [book's repository](#).

Each line corresponds to a token in the file (Image from [Section 4.2: Lexemes & Tokens](#)):

```
var language = "lox";
```

This is the format for each line:

Tests failed. ?
