## Your Task

In-progress

EASY

In this stage, you'll extend the `decode` command to support bencoded integers.

Integers are encoded as `i<number>e`. For example, `52` is encoded as `i52e` and `-52` is encoded as `i-52e`.

Here's how the tester will execute your program:

```
$ ./your_bittorrent.sh decode i52e
52
```

If you'd prefer to use a library crate for this stage, [serde-bencode](#) is available for you to use.
