 **We're still working on instructions for this stage.** You can find notes on how the tester works below.

Tests

The tester will execute your program as a master like this:

```
./spawn_redis_server.sh
```

It'll then start **multiple** replicas that connect to your server. Each will complete the handshake and expect to receive an empty RDB file.

It'll then connect to your master as a Redis client (not one of the replicas) and send commands like this:

```
$ redis-cli WAIT 3 500 # (expecting 7 back)
$ redis-cli WAIT 7 500 # (expecting 7 back)
$ redis-cli WAIT 9 500 # (expecting 7 back)
```

The response to each of these commands should be encoded as a RESP integer (i.e. `:7\r\n`).
