

Your Task

Pending[Share Feedback](#)**EASY**

In this stage, you'll implement the `/echo/{str}` endpoint, which accepts a string and returns it in the response body.

Response body

A response body is used to return content to the client. This content may be an entire web page, a file, a string, or anything else that can be represented with bytes.

Your `/echo/{str}` endpoint must return a `200` response, with the response body set to given string, and with a `Content-Type` and `Content-Length` header.

Here's an example of an `/echo/{str}` request:

```
GET /echo/abc HTTP/1.1\r\nHost: localhost:4221\r\nUser-Agent: curl/7.64
```

And here's the expected response:

```
HTTP/1.1 200 OK\r\nContent-Type: text/plain\r\nContent-Length: 3\r\n\r\nabc
```
