Stage #KF3

In-progress

Your Task

In-progress

EASY

You'll now pipe the program's stdout and stderr to the parent process.

Like the last stage, the tester will run your program like this:

```
mydocker run alpine:latest /usr/local/bin/docker-explorer echo hey
```

To test this behaviour locally, you could use the `echo + echo_stderr` commands that `docker-explorer` exposes. Run `docker-explorer --help` to view usage.

If you've got any logs or print statements in your code, make sure to remove them. The tester can't differentiate between debug logs and the actual output!

Note: The **README** in your repository contains setup information for this stage and beyond (takes < 5 min).
