

[Instructions](#) [Code Examples](#) [Forum](#)Stage #GJ9 **Pending**

The unary operator `-` will throw a runtime error if the operand is not a number.

For example, if `test.lox` contains the following:

```
- "hello world!"
```

The tester will run your program like this:

```
$ ./your_program.sh evaluate test.lox
Operand must be a number.
[line 1]
```

The tester will run multiple such tests with randomized expressions, for example:

Input	Expected output
<code>- "foo"</code>	Operand must be a number.
<code>- true</code>	Operand must be a number.
<code>- ("foo" + "bar")</code>	Operand must be a number.
<code>- false</code>	Operand must be a number.
