For anyone having a hard time understanding the documentation of MySQL. you can use a binary editor like <https://hexed.it/> to view the contents of sample.db file and reference it with the documentation.

"hexdump -C sample.db" also gives you pretty similar results from the command line

I would also recommend <https://github.com/WerWolv/ImHex>

If anyone is stuck like I was, the first page includes the database header. That means the first page is considered from 0 bytes to page-size bytes of the file. This also implies (important!!), that the cell pointer array contains offsets with reference to the 0th position of the file and not the 100th.
