MEDIUM

In this stage, you'll add support for multiple concurrent transactions.

Multiple transactions

There can be multiple transactions open (i.e. `MULTI` has been called, but `EXEC` has not been called yet) at the same time. Each transaction gets its own command queue.

For example, say you started transaction 1 from one connection:

```
$ redis-cli
> MULTI
OK
> SET foo 41
QUEUED
> INCR foo
QUEUED
```

and started transaction 2 from another connection:

```
$ redis-cli
> MULTI
OK
> INCR foo
QUEUED
```
