EASY

In this stage, you'll extend support for `XRANGE` to allow querying using `+`.

### Using `XRANGE` with `+`

In the previous stage, we saw that `XRANGE` takes `start` and `end` as arguments.

In addition to accepting an explicit entry ID, `end` can also be specified as `+`.

When `+` is used, `XRANGE` retrieves entries until the end of the stream.

Here's an example of how that works.

We'll use our previous example for entries existing in a stream.

```
$ redis-cli XADD some_key 1526985054069-0 temperature 36 humidity 95
"1526985054069-0"
$ redis-cli XADD some_key 1526985054079-0 temperature 37 humidity 94
"1526985054079-0"
$ redis-cli XRANGE some_key 1526985054069 +
1) 1) 1526985054069-0
   2) 1) temperature
      2) 36
      3) humidity
      4) 95
2) 1) 1526985054079-0
   2) 1) temperature
      2) 37
      3) humidity
      4) 94
```
