Stage #UE7

Pending

The tester will run your program like this:

```
$ ./your_program.sh tokenize test.lox
[line 1] Error: Unterminated string.
EOF null
```

The tester will assert that an error is raised, and that the error string matches the format above.

## Notes

- This output format matches the spec in the [book's repository](#)
- The `<LEXEME>` field will contain the string's contents including quotes, since it represents the actual characters that matched the token. The `<LITERAL>` field will contain the string's contents without quotes, since it represents the string's value.
- Lox doesn't support escape sequences within strings, so you can't include a `"` inside a string.
- When scanning for tokens, it's valid to have "unbalanced" parentheses or braces. When we get to parsing expressions in later stages, these cases will be highlighted as errors.
