MEDIUM

In this stage, you'll add support for handling failures within a transaction.

Failures within transactions

When executing a transaction, if a command fails, the error is captured and returned within the response for `EXEC`. All other commands in the transaction are still executed.

You can read more about this behaviour [in the official Redis docs](#).

Example:

```
$ redis-cli
> MULTI
OK
> SET foo xyz
QUEUED
> INCR foo
QUEUED
> SET bar 7
> EXEC
1) OK
2) (error) ERR value is not an integer or out of range
3) OK
```

In the example above, note that the error for the `INCR` command was returned

as the second array element. The third command (`SET bar 7`) was still executed.
