

The tester will then send a `GET` request to the `/user-agent` endpoint on your server. The request will have a `User-Agent` header.

```
$ curl -v --header "User-Agent: foobar/1.2.3" http://localhost:4221/use
```

Your server must respond with a `200` response that contains the following parts:

- `Content-Type` header set to `text/plain`.
- `Content-Length` header set to the length of the `User-Agent` value.
- Message body set to the `User-Agent` value.

```
HTTP/1.1 200 OK\r\nContent-Type: text/plain\r\nContent-Length: 12\r\n\r'
```

Notes

- Header names are [case-insensitive](#).
