HARD

 **We're still working on instructions for this stage.** You can find notes on how the tester works below.

Tests

The tester will execute your program as a master like this:

```
./spawn_redis_server.sh
```

It'll then start **multiple** replicas that connect to your server. Each will complete the handshake and expect to receive an empty RDB file.

The tester will then connect to your master as a Redis client (not one of the replicas) and send multiple write commands interleaved with `WAIT` commands:

```
$ redis-cli SET foo 123
$ redis-cli WAIT 1 500 # (must wait until either 1 replica has processed pre

$ redis-cli SET bar 456
$ redis-cli WAIT 2 500 # (must wait until either 2 replicas have processed p
```

Notes

- The `WAIT` command should return when either (a) the specified number of
