

request, read the response, & validate the response.

Once a response is received, the tester will re-use the same connection to send multiple other `APIVersions` (v4) requests.

For each response, the tester will validate that:

- The first 4 bytes of your response (the "message length") are valid.
- The correlation ID in the response header matches the correlation ID in the request header.
- The error code in the response body is `0` (No Error).
- The response body contains at least one entry for the API key `18` (`API_VERSIONS`).
- The `MaxVersion` for the `ApiKey 18` is at least `4`.

Notes

- The tester will only send `APIVersions` (v4) requests in this stage.
- If extra bytes are remaining after decoding all the fields of the response body, this will be considered an error.
