## Your Task

Pending

Share Feedback

HARD

In this stage, you'll add support for handling concurrent requests from multiple clients.

## Tests

The tester will execute your program like this:

```
$ ./your_program.sh
```

It'll then instantiate 2-3 clients. Each of these clients will connect to your server on port 9092 and send multiple `APIVersions` (v4) requests.

For each response, the tester will validate that:

- The first 4 bytes of your response (the "message length") are valid.
