

You can use a server testing cli called [oha](#) , which sends multiple concurrent requests by default. You can use it like `oha http://localhost:4221` .

An easy way to test this locally would be to use `nc` to create a connection to your server and then use `curl` to hit it with a request. i.e. `nc localhost 4221` in one window followed by `curl localhost:4221` in a separate terminal window.

For windows, which doesn't have `nc` built-in. `ncat` is a suitable substitute.

Docs : <https://nmap.org/ncat/>

Windows portable version : <https://nmap.org/dist/ncat-portable-5.59BETA1.zip>

After unzipping its just `ncat localhost 4221`
