EASY

In this stage, you'll add support for the **MULTI** command.

The MULTI command

The [MULTI](#) command starts a transaction.

After a **MULTI** command is executed, any further commands from the same connection will be "queued" but not executed.

Example usage:

```
$ redis-cli
> MULTI
OK
> SET foo 41
QUEUED
> INCR foo
QUEUED
```

The queued commands can be executed using [EXEC](#), which we'll cover in later stages.

In this stage, you'll just add support for handling the **MULTI** command and returning `+OK\r\n`. We'll get to queueing commands in later stages.
