

[Instructions](#) [Code Examples](#) [Forum](#)Stage #IZ6 **Pending**

The `evaluate` command accepts a path to a file (`test.lox` for example) and prints out the result of evaluating the file to stdout.

For example, if `test.lox` contains the following:

```
2 + 3
```

The `evaluate` command will return the following:

```
$ ./your_program.sh evaluate test.lox
5
```

This output format matches the spec in the [book's repository](#).

For the same file, here's what the output from `parse` would've been:

```
$ ./your_program.sh parse test.lox
(+ 2.0 3.0)
```

Tests

The tester will run a series of tests with `test.lox` files that contain the
