EASY

In this stage, you'll add support for validating entry IDs to the `XADD` command.

Entry IDs

Here's an example of stream entries from the previous stage:

`entries:`

- `id: 1526985054069-0` # (ID of the first entry)
 `temperature: 36` # (A key value pair in the first entry)
 `humidity: 95` # (Another key value pair in the first entry)
- `id: 1526985054079-0` # (ID of the second entry)
 `temperature: 37` # (A key value pair in the first entry)
 `humidity: 94` # (Another key value pair in the first entry)

`# ...` (and so on)

Entry IDs are always composed of two integers:

`<millisecondsTime>-<sequenceNumber>` .

Entry IDs are unique within a stream, and they're guaranteed to be incremental - i.e. an entry added later will always have an ID greater than an entry added in the past. More on this in the next section.

Specifying entry IDs in XADD
