Stage #RS9

Pending

... (and so on, until EXEC is executed)

When commands are queued, they should not be executed or alter the database in any way.

In the example above, until EXEC is executed, the key `foo` will not exist.

Tests

The tester will execute your program like this:

```
$ ./spawn_redis_server.sh
```

The tester will then connect to your server as a Redis client, and send multiple commands using the same connection:

```
$ redis-cli
> MULTI
> SET foo 41 (expecting "+QUEUED\r\n")
> INCR foo (expecting "+QUEUED\r\n")
```

Since these commands were only "queued", the key `foo` should not exist yet. The tester will verify this by creating another connection and sending this command:

```
$ redis-cli GET foo (expecting `-$-1\r\n` as the response)
```
