

```
$ ./spawn_redis_server.sh
```

First, it'll add a few entries.

```
$ redis-cli XADD stream_key 0-1 foo bar
"0-1"
$ redis-cli XADD stream_key 0-2 bar baz
"0-2"
$ redis-cli XADD stream_key 0-3 baz foo
"0-3"
```

Then, it'll send an `XRANGE` command to your server.

```
$ redis-cli XRANGE stream_key 0-2 0-3
```

Your server should respond with the following (encoded as a RESP Array):

```
[
  [
    "0-2",
    [
      "bar",
      "baz"
    ]
  ],
  [
    "0-3",
    [
      "baz",
      "foo"
    ]
  ]
]
```
