EASY

In this stage, you'll add support for handling the `INCR` command when a key exists but doesn't have a numerical value.

Recap

The implementation of [INCR](#) is split into three stages:

- Key exists and has a numerical value (previous stages)
- Key doesn't exist (previous stages)
- Key exists but doesn't have a numerical value (**This stage**)

When a key exists but doesn't have a numerical value, `INCR` will return an error.
Example:

```
$ redis-cli SET foo xyz
"OK"
$ redis-cli INCR foo
(error) ERR value is not an integer or out of range
```

Tests

The tester will execute your program like this:

```
$ ./spawn_redis_server.sh
```
