

get to that in the next stages. For now you can just split the input by " " and pick the last item to get the table name.

rootpage stores page number of root b-tree page for tables and indexes.

Page number is 1-indexed so to get the offset we need to subtract `page_number - 1`

Examples

`table=sqlite_schema, rootpage=1 -> offset = 0`

`table=apples, rootpage=2 -> offset = (2 - 1) * page_size`
