Stage #CE0

In-progress

Found the sqlite documentation a bit dense, this helped to get a grasp of high level details:

- The first **page** of the database file (after the database header) contains a **leaf table b-tree page**
- Each **cell** in this **leaf table b-tree page** has a **payload** that contains a **record**. (see [diagram](#)). The body of each record corresponds to a row of [sqlite_schema](#) table
- Since [sqlite_schema](#) table stores information about tables in our database, number of cells in this leaf table b-tree page will give us number of tables in the database
- You can determine the number of cells by reading [B-tree Page Header](#) (right after the database header)

This helped me to visualize the underlying binary with schemes and drawings:

The number of cells stored in the root page of `sqlite_master` includes all the types of entries, not only tables, and if this is not a leaf node, you should traverse the whole tree to find the # of tables

All the previous links were really helpful. It also helped me to read the page type in tree page header in the official docs [here](#) That table also lists the offsets for the nu.
