Your Task Pending

EASY

In this stage, you'll extend the `decode` command to support bencoded lists.

Lists are encoded as `l<bencoded_elements>e`.

For example, `["hello", 52]` would be encoded as `l5:helloi52ee`. Note that there are no separators between the elements.

Here's how the tester will execute your program:

```
$ ./your_bittorrent.sh decode l5:helloi52ee  
["hello",52]
```

If you'd prefer to use a library crate for this stage, [serde-bencode](#) is available for you to use.
