

You can use the [reqwest](#) crate to make HTTP requests, we've included it in the `Cargo.toml` file.

## Tests

The tester will run your program like this:

```
$ /path/to/your_git.sh clone https://github.com/blah/blah <some_dir>
```

Your program must create `<some_dir>` and clone the given repository into it.

To verify your changes, the tester will:

- Check the contents of a random file
- Read commit object attributes from the `.git` directory
