

First, an entry will be added.

```
$ redis-cli XADD stream_key 0-1 temperature 96
```

It'll then send an `XREAD` command to your server.

```
$ redis-cli XREAD streams stream_key 0-0
```

Your server should respond with the following:

```
*1\r\n
*2\r\n
$9\r\nstream_key\r\n
*1\r\n
*2\r\n
$3\r\n0-1\r\n
*2\r\n
$11\r\ntemperature\r\n
$2\r\n96\r\n
```

This is the RESP encoded representation of the following.

```
[
  [
    "stream_key",
    [
      [
        "0-1",
        [
          "temperature",
          "96"
        ]
      ]
    ]
  ]
]
```

Ready to run tests...
