Your Task ✅ Completed   [Share Feedback]   **VERY EASY**

Your task is to implement a very basic version of `docker run` . It will be executed similar to `docker run` :

```
mydocker run ubuntu:latest /usr/local/bin/docker-explorer echo hey
```

docker-explorer is a custom test program that exposes commands like `echo` and `ls` .

For now, don't worry about pulling the `ubuntu:latest` image. We will just execute a local program for this stage and print its output. You'll work on pulling images from Docker Hub in stage 6.
