(i.e. `:7\r\n`).

Notes

- Even if WAIT is called with a number lesser than the number of connected replicas, the master should return the count of connected replicas.

- The number of replicas created in this stage will be random, so you can't hardcode `7` as the response like in the example above.

When I was reading the assignment I thought I should return value that I got as an input or amount of replicas. If amount of replicas is bigger. In reality when I read the doc about wait command: **https://redis.io/commands/wait/** I realised that I should always ans with the amount of replicas that "confirmed" the response. Doesn't matter how b. number came as an input.
