Stage #NC5   Pending

It'll then connect to your server on port 9092 and send a `APIVersions` request. This request will include an invalid `APIVersion` (Examples: `-1` or `1234`).

Any version other than 0, 1, 2, 3 and 4 should be considered an invalid version.

Your server should respond with an error code of `35` (UNSUPPORTED_VERSION).

The tester will validate that:

- The correlation ID in the response header matches the correlation ID in the request header.
- The error code in the response body is `35` (UNSUPPORTED_VERSION).

The tester won't validate the first 4 bytes of your response (the "message length") in this stage. We'll get to this in later stages.

Notes

- The `APIVersions` request will be sent with an invalid `APIVersion` (Examples: `-1` or `1234`).
