```
$ redis-cli XADD stream_key 1-2 baz foo
(error) ERR The ID specified in XADD is equal or smaller than the target str
```

Your server should respond with "-ERR The ID specified in XADD is equal or smaller than the target stream top item\r\n", which is the error message above encoded as a **simple error**.

The tester will then send another  XADD  command with a smaller value for the time and a larger value for the sequence number.

```
$ redis-cli XADD stream_key 0-3 baz foo
(error) ERR The ID specified in XADD is equal or smaller than the target str
```

Your server should also respond with the same error message.

After that, the tester will send another  XADD  command with  0-0  as the ID.

```
$ redis-cli XADD stream_key 0-0 baz foo
```

Your server should respond with "-ERR The ID specified in XADD must be greater than 0-0\r\n", which is the error message above encoded as a **RESP simple error**.
