Instructions   </> Code Examples   💬 Forum   Stage #PV1   **Pending**

It'll then connect to your server on port 9092 and send a valid `APIVersions` (v4) request.
The tester will validate that:

- The first 4 bytes of your response (the "message length") are valid.

- The correlation ID in the response header matches the correlation ID in the request header.

- The error code in the response body is `0` (No Error).

- The response body contains at least one entry for the API key `18` (API_VERSIONS).

- The `MaxVersion` for the `ApiKey` `18` is at least `4` .

Notes

- The tester will always send you v4 of the APIVersions request.

- From this stage onwards, the tester will start validating the first 4 bytes of your response (the "message length") in addition to the other checks.

- If extra bytes are remaining after decoding all the fields of the response body, this will be considered an error.
