Your Task (Pending)   [Share Feedback]   EASY

In this stage, you'll add support for the TYPE command.

The TYPE command

The **TYPE** command returns the type of value stored at a given key.

It returns one of the following types: string, list, set, zset, hash, and stream.

Here's how it works:

```
$ redis-cli SET some_key foo
"OK"
$ redis-cli TYPE some_key
"string"
```

If a key doesn't exist, the return value will be "none".

```
$ redis-cli TYPE missing_key
"none"
```

The return value is encoded as a **simple string**.

Tests

The tester will execute your program like this:
