In this stage, you'll add support for block syntax in your interpreter. Blocks are enclosed in curly braces `{}` and are used to group statements together. They are also used to create local scopes. We will test scopes in the next stage, in this stage you just need to handle the block syntax.

Book reference

The code for this stage is implemented in **Section 8.5.2: Block syntax and semantics**.

Tests

The tester will run a series of tests with `test.lox` files that contain the assignment operation.
