Needs a note here that on a mac, Cloneflags is not going to be available

```
cmd.SysProcAttr = &syscall.SysProcAttr{
    Cloneflags: syscall.CLONE_NEWUTS | syscall.CLONE_NEWPID,
}
```

I had to add this to the top of main.go

```
//go:build linux
// +build linux
```

and then it'll be fine

Here's a talk from a Docker employee that goes over how Docker uses cgroups, namespaces and more: **https://www.youtube.com/watch?v=sK5i-N34im8.**
