For example, if `test.lox` contains the following:

```
(72 +)
```

The tester will run your program like this:

```
$ ./your_program.sh parse test.lox
[line 1] Error at ')': Expect expression.
```

The tester will assert that the exit code is 65.

Notes

- This output format matches the spec in the **book's repository**

- The tester won't check the exact error message in this stage, it will only check that the program exits with code 65.
