stages.

In this stage, you'll just add support for handling the `MULTI` command and returning `+OK\r\n`. We'll get to queueing commands in later stages.

## Tests

The tester will execute your program like this:

```
./spawn_redis_server.sh
```

The tester will then connect to your server as a Redis client and run the following command:

```
$ redis-cli MULTI
```

The tester will expect `+OK\r\n` as the response.

## Notes

- We'll test queueing commands & executing a transaction in later stages.
