```
$ redis-cli KEYS "*"
```

Your server must respond with a RESP array that contains the key from the RDB file:

```
*1\r\n$3\r\nfoo\r\n
```

Notes

- The RDB file provided by `--dir` and `--dbfilename` might not exist. If the file doesn't exist, your program must treat the database as empty.

- RDB files use both little-endian and big-endian to store numbers. See the [MDN article on endianness](#) to learn more.

- To generate an RDB file, use the [SAVE command](#).
