In this stage, you'll extend support to `XREAD` to allow for the blocking command
not timing out.

Understanding blocking without timeout

Here's how it works.

Let's use the entries previously shown as an example.

```
entries:
  - id: 1526985054069-0 # (ID of the first entry)
    temperature: 36 # (A key value pair in the first entry)
    humidity: 95 # (Another key value pair in the first entry)

  - id: 1526985054079-0 # (ID of the second entry)
    temperature: 37 # (A key value pair in the first entry)
    humidity: 94 # (Another key value pair in the first entry)

  # ... (and so on)
```

On one instance of the redis-cli, we'd add an entry and send a blocking `XREAD`
command with 0 as the time passed in.

```
$ redis-cli XADD some_key 1526985054069-0 temperature 36 humidity 95
"1526985054069-0"
$ redis-cli XREAD block 0 streams some_key 1526985054069-0
```
