```
$ ./your_program.sh /tmp/server.properties
```

It'll then connect to your server on port 9092 and send a valid `APIVersions` (v4) request.

The tester will validate that:

- The first 4 bytes of your response (the "message length") are valid.

- The correlation ID in the response header matches the correlation ID in the request header.

- The error code in the response body is `0` (No Error).

- The response body contains at least one entry for the API key 18 (`APIVersions`) and one entry for the API key 75 (`DescribeTopicPartitions`).

- The response for the API key 18 (`APIVersions`) has a `MaxVersion` of at least 4, and a `MinVersion` of at least 0.

- The response for the API key 75 (`DescribeTopicPartitions`) has a `MaxVersion` of at least 0, and a `MinVersion` of at least 0.

Notes

- The `MaxVersion` for the `DescribeTopicPartitions` and `APIVersions` are
