🚧 **We're still working on instructions for this stage**. You can find notes on how the tester works below.

Tests

The tester will execute your program like this:

```
./spawn_redis_server.sh
```

A redis client will then connect to your master and send `WAIT 0 60000`:

```
$ redis-cli WAIT 0 60000
```

It'll expect to receive `0` back immediately, since no replicas are connected.

Notes

- You can hardcode `0` as the response for the WAIT command in this stage. We'll get to tracking the number of replicas and responding accordingly in the next stages.
