If you're trying to go through the RDB Persistence extension using Rust and can't pass the tests, make sure to fix your `spawn_redis_server.sh` in order to pass arguments to the binary correctly. I've sent a PR to fix this, but that won't get to those that started the challenge before it's accepted. Here's a patch:

```
--- a/spawn_redis_server.sh
+++ b/spawn_redis_server.sh
@@ -9,4 +9,5 @@ exec cargo run \
     --quiet \
     --release \
     --target-dir=/tmp/codecrafters-redis-target \
-    --manifest-path $(dirname $0)/Cargo.toml "$@"
+    --manifest-path $(dirname $0)/Cargo.toml \
+    -- "$@"
```

The important part are those `--` before `"$@"`.

Small note: the database file passed in this stage doesn't actually exist, however the db server should start as if nothing is wrong, so that the test can execute the commands.

That caused some head scratching for me in next stage.

If you receive this error when using the CodeCrafters CLI tool or pushing with Git when using Elixir.

`[your_program] ** (Mix) No such file: --dir`.

That means Mix is receiving the `--dir` argument instead of your Elixir application.

Update the langage_pack to the latest supported elixir language pack (it's currently elixir-1.16 while writing) in the `codecrafters.yml` to resolve this issue
