Stage #DH6   [Pending]

It'll then connect to your server on port 9092 and send a `Fetch` (v16) request. The request will contain an empty array of topics.
The tester will validate that:

- The first 4 bytes of your response (the "message length") are valid.

- The correlation ID in the response header matches the correlation ID in the request header.

- The error code in the response body is `0` (No Error).

- The `throttle_time_ms` field in the response is present (any value is accepted).

- The `session_id` field in the response is `0`.

- The `responses` field in the response has 0 elements (since the request had an empty array of topics).

Notes

- You don't need to parse the fields in the `Fetch` request in this stage, we'll get to this in later stages.

- The official docs for the `Fetch` request can be found here. Make sure to scroll down to the "Fetch Response (Version: 16)" section.
