◀ ▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮ ▶

Do you mean you need to do this within *one* connection? Because otherwise this suggests that being able to do `redis-cli ping` multiple times is good enough. And the solution for stage-2 would be sufficient for that purpose.

Ah, good catch. I've updated the instructions to make this more clear:

> *you'll respond to multiple PING commands sent by the same ~~client~~ connection.*

The test seems to be expecting servers to handle case-insensitive command keys, but I haven't been able to find anything in the spec which suggests that this is correct.

This isn't defined in the **redis protocol spec**, but it is mentioned in the **COMMAND** page:

> **Note**: *Redis command names are case-insensitive.*

Our tester isn't designed to test case insensitivity specifically, it's just that we use the official **redis-go** client to test your implementation and it uses lowercase commands by default.
